

# Network layer: “control plane” roadmap

- introduction
- routing protocols
- intra-ISP routing: OSPF
- routing among ISPs: BGP
- **SDN control plane**
- Internet Control Message Protocol

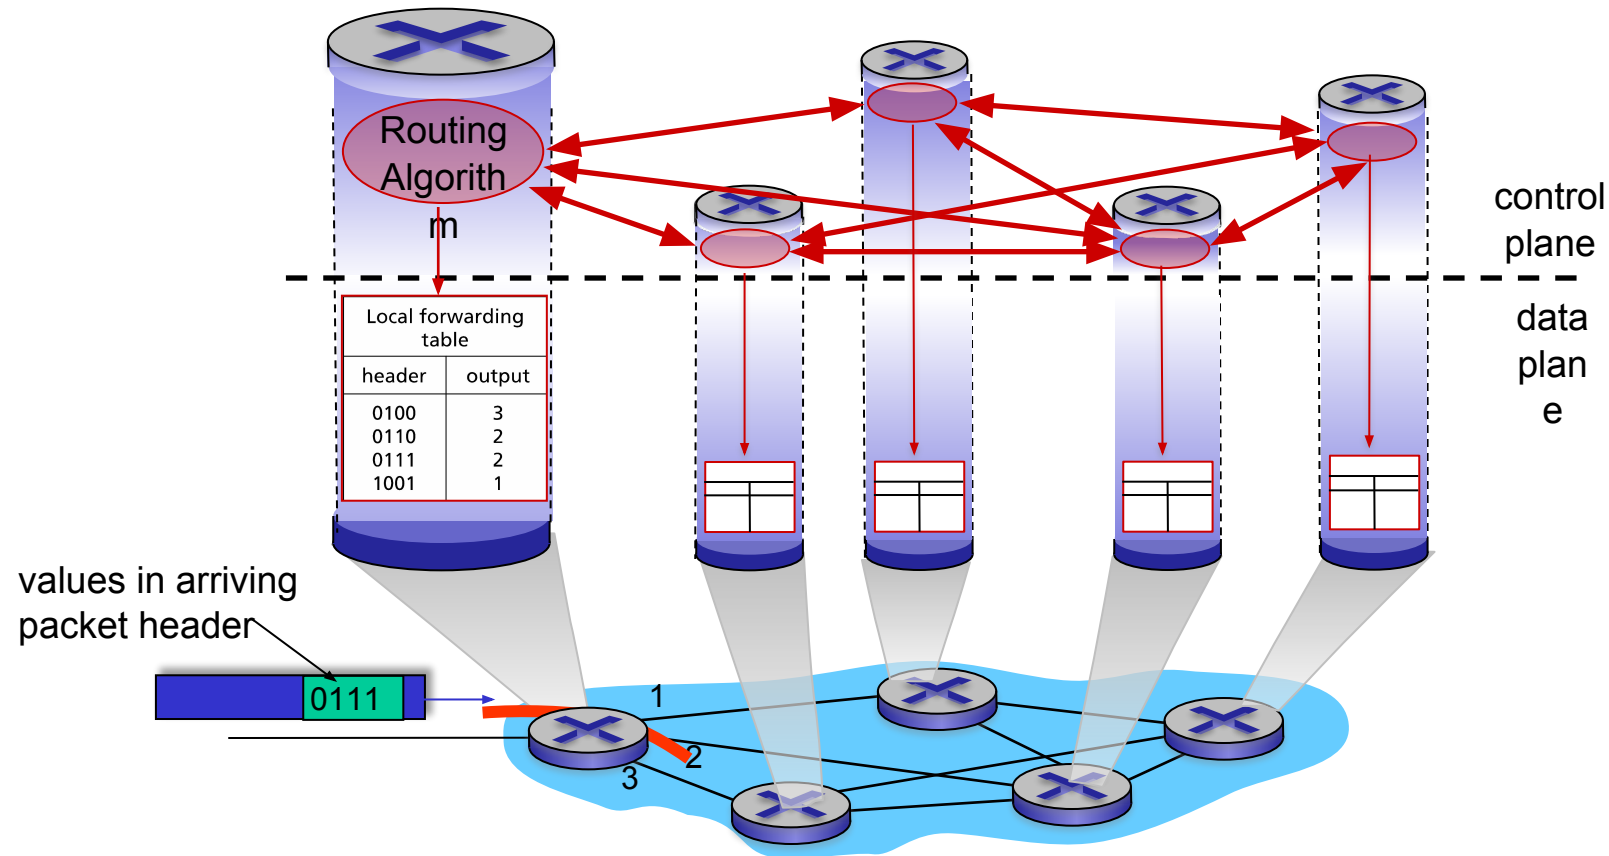

- network management, configuration
  - SNMP
  - NETCONF/YANG

# Software defined networking (SDN)

- Internet network layer: historically implemented via distributed, per-router control approach:
  - *monolithic* router contains switching hardware, runs proprietary implementation of Internet standard protocols (IP, RIP, IS-IS, OSPF, BGP) in proprietary router OS (e.g., Cisco IOS)
  - different “middleboxes” for different network layer functions: firewalls, load balancers, NAT boxes, ..
- ~2005: renewed interest in rethinking network control plane

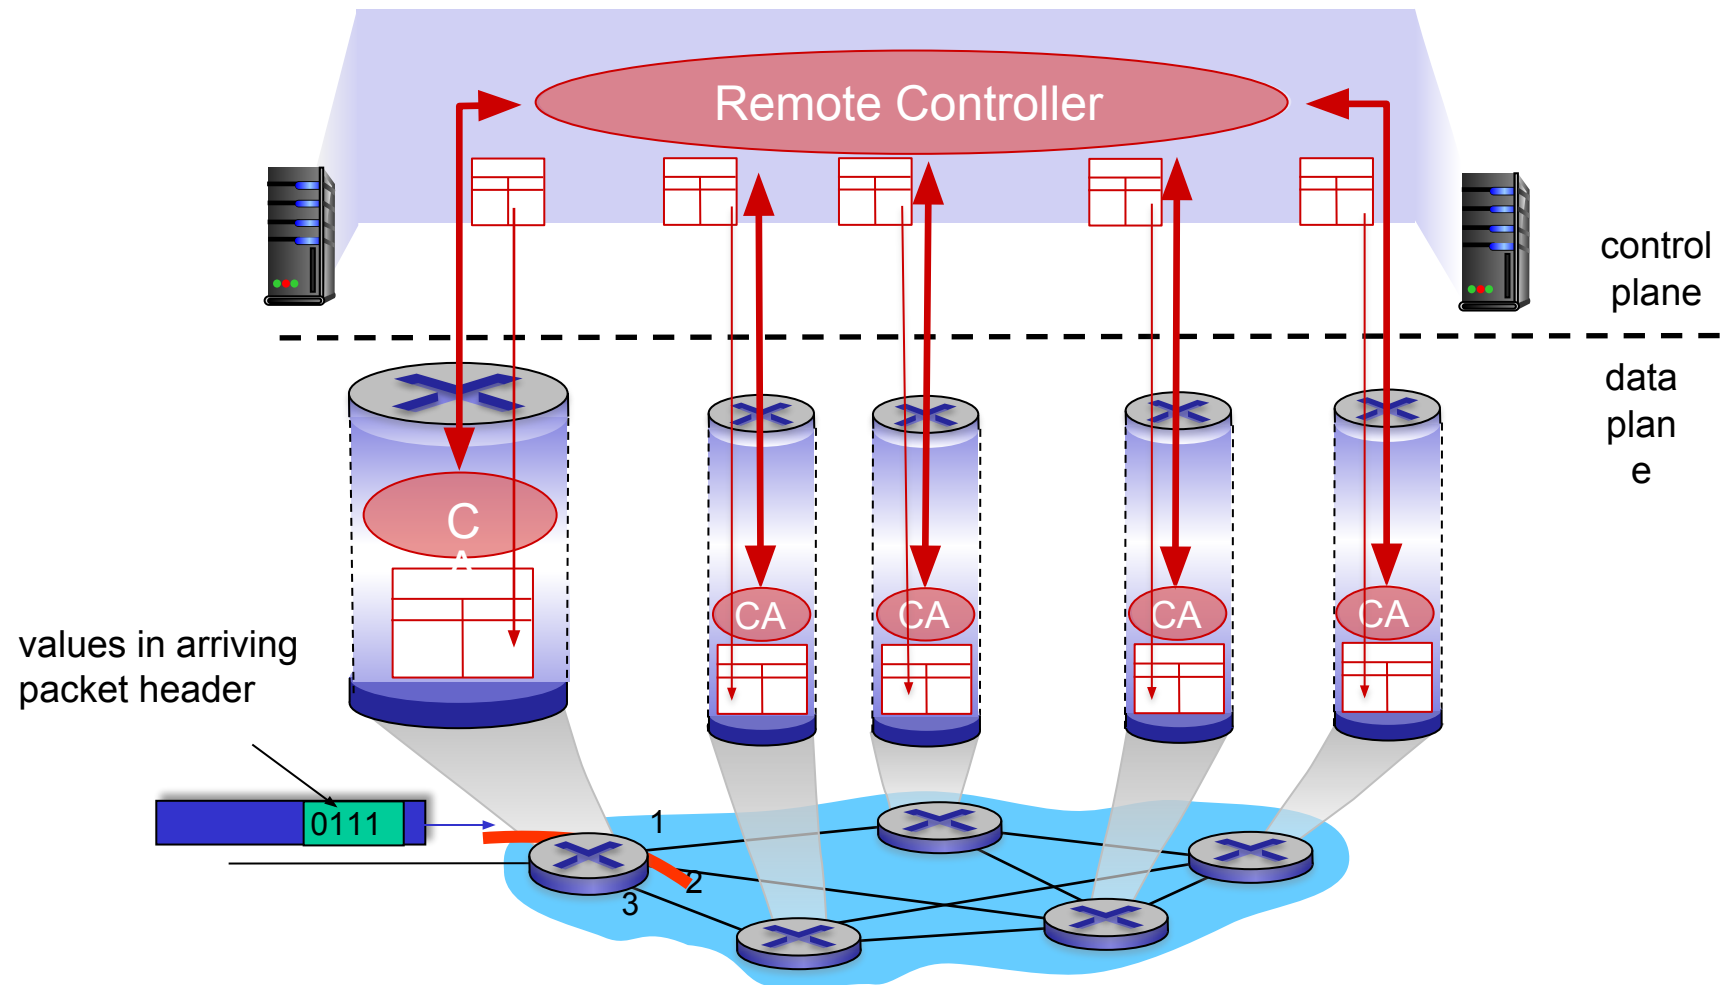

# Per-router control plane

Individual routing algorithm components *in each and every router* interact in the control plane to compute forwarding tables

# Software-Defined Networking (SDN) control plane

Remote controller computes, installs forwarding tables in routers

# Software defined networking (SDN)

*Why* a *logically centralized* control plane?

- easier network management: avoid router misconfigurations, greater flexibility of traffic flows
- table-based forwarding (OpenFlow API) allows “programming” routers
  - centralized “programming” easier: compute tables centrally and distribute
  - distributed “programming” more difficult: compute tables as result of distributed algorithm (protocol) implemented in each-and-every router
- open (non-proprietary) implementation of control plane
  - foster innovation: let 1000 flowers bloom

# SDN analogy: mainframe to PC revolution

Vertically integrated  
Closed, proprietary  
Slow innovation  
Small industry

Horizontal  
Open interfaces  
Rapid innovation  
Huge industry

# Traffic engineering: difficult with traditional routing

Q: what if network operator wants u-to-z traffic to flow along  $uvwz$ , rather than  $uxyz$ ?

A: need to re-define link weights so traffic routing algorithm computes routes accordingly (or need a new routing algorithm)!

*link weights are only control “knobs”: not much control!*

# Traffic engineering: difficult with traditional routing

Q: what if network operator wants to split u-to-z traffic along uvwz *and* uxyz (load balancing)?

A: can't do it (or need a new routing algorithm)

# Traffic engineering: difficult with traditional routing

Q: what if w wants to route blue and red traffic differently from w to z?

A: can't do it (with destination-based forwarding, and LS, DV routing)

Note: Generalized forwarding and SDN can be used to achieve *any* routing desired

# Software defined networking (SDN)
